

UNIMAC

According to a recent survey, 79 percent of commercial laundry distributors and managers believe that on-premises laundries over-dry an average of eight minutes per cycle, wasting thousands of dollars in utility and labor costs. In addition, linens experience 31 percent less fiber loss when over-drying is eliminated. OPTidry exclusive over-dry prevention technology connects sensors located within the lifters to UniMac's revolutionary rotary transfer switch, resulting in a pinpoint dryness reading throughout the entire load and allowing the machine to automatically shut off once dryness levels have been reached.
