

Hard-Mount Washer-Extractor

UniMac recently introduced the UW45 and UW65 hardmount washer-extractors, which are designed to handle double the spinning force

of commercial units. The new drive shaft assembly features cylindrical front and spherical rear bearings, which can handle heavier loads and have a longer life than traditional ball

bearings. The larger-shaft diameter is built to be 200% stronger than cabinet hard-mount shafts. The units also feature a taller frame with a 28-inch cart clearance and elevated drain height. The machines feature a 400 G-Force extraction speed and a proprietary designed inverter drive.
